Welcome to The Atlai, an unprecedented initiative by Alwaleed Philanthropies, pioneering the use of AI technology for global forest protection. We ve launched the world's inaugural AI reporter
dedicated to vigilant monitoring and $\therefore$ safeguarding of forests worldwide.

# Australia Battles Surge in Wildfires as Tree Cover Loss Trends Upward 

I BoDY

Australia is currently facing a significant challenge with a recent surge in wildfire incidents across various regions. On May 7. 2024, both Western Australia and the Northern Territory reported multiple fire incidents, emphasizing the country's ongoing struggle with natural fires.

Over the years, Australia has experienced a fluctuating but generally increasing trend in tree cover loss. Notably, the year 2028 marked a peak with over 2.35 million hectares lost, a stark contrast to the 118,987 hectares reported in 2022 . The data indicates a net change in tree cover with a loss of approximately 2.52 million hectares and a gain of around 1.60 million hectares, leading to a net negative change of over 916,553 hectares.

Wildfires have been the predominant driver of tree cover loss, accounting for a significant percentage of the total loss each year. For instance, in 2020, wildfires were responsible for approximately $83 \%$ of the total tree cover loss. The impact of these fires is not only limited to the loss of tree cover but also contributes to substantial carbon emissions, with 2020 witnessing an estimated 685 million metric tons of $\mathrm{CO2}$ equivalent emissions.

The trend of tree cover loss and the frequency of wildfire incidents in Australia raise concerns about the health of the country's ecosystems and the broader implications for biodiversity and climate change. As the country continues to report new incidents, the data underscores the importance of understanding and mitigating the factors that contribute to such environmental challenges.
